12. Conflict (score)	3.46	12. Conflict (score)	
12. Conflict (rank)	18	12. Conflict (rank)	
1.0 - Aridity (score)	1.41	The aridity risk indicator is based on the Global Aridity Index (Global-Aridity) and Global Potential Evapo-Transpiration (Global-PET) Geospatial data sets by Trabucco and Zomer (2009). These data sets provide information about the potential availability of water in regions with low water demand, thus they are used in the Water Risk Filter 5.0 to better account for deserts and other arid areas in the risk assessment.	Trabucco, A., & Zomer, R. J. (2009). Global potential evapo-transpiration (Global-PET) and global aridity index (Global-Aridity) geo-database. CGIAR consortium for spatial information.
1.0 - Aridity (rank)	85	The aridity risk indicator is based on the Global Aridity Index (Global-Aridity) and Global Potential Evapo-Transpiration (Global-PET) Geospatial data sets by Trabucco and Zomer (2009). These data sets provide information about the potential availability of water in regions with low water demand, thus they are used in the Water Risk Filter 5.0 to better account for deserts and other arid areas in the risk assessment.	Trabucco, A., & Zomer, R. J. (2009). Global potential evapo-transpiration (Global-PET) and global aridity index (Global-Aridity) geo-database. CGIAR consortium for spatial information.
1.1 - Water Depletion (score)	1.70	The water depletion risk indicator is based on annual average monthly net water depletion from Brauman et al. (2016). Their analysis is based on model outputs from the newest version of the integrated water resources model WaterGAP3 which measures water depletion as the ratio of water consumption-to-availability.	Brauman, K. A., Richter, B. D., Postel, S., Malsy, M., & Flörke, M. (2016). Water depletion: An improved metric for incorporating seasonal and dry-year water scarcity into water risk assessments. Elem Sci Anth, 4.
1.1 - Water Depletion (rank)	96	The water depletion risk indicator is based on annual average monthly net water depletion from Brauman et al. (2016). Their analysis is based on model outputs from the newest version of the integrated water resources model WaterGAP3 which measures water depletion as the ratio of water consumption-to-availability.	Brauman, K. A., Richter, B. D., Postel, S., Malsy, M., & Flörke, M. (2016). Water depletion: An improved metric for incorporating seasonal and dry-year water scarcity into water risk assessments. Elem Sci Anth, 4.
1.2 - Baseline Water Stress (score)	2.35	World Resources Institute's Baseline Water Stress measures the ratio of total annual water withdrawals to total available annual renewable supply, accounting for upstream consumptive use. A higher percentage indicates more competition among users.	Hofste, R., Kuzma, S., Walker, S., ... & Sutanudjaja, E.H. (2019). Aqueduct 3.0: Updated decision relevant global water risk indicators. Technical note. Washington, DC: World Resources Institute.

Country Overview - Romania

Indicator	Value	Description	Source
1.2 - Baseline Water Stress (rank)	79	World Resources Institute's Baseline Water Stress measures the ratio of total annual water withdrawals to total available annual renewable supply, accounting for upstream consumptive use. A higher percentage indicates more competition among users.	Hofste, R., Kuzma, S., Walker, S., ... & Sutanudjaja, E.H. (2019). Aqueduct 3.0: Updated decision relevant global water risk indicators. Technical note. Washington, DC: World Resources Institute.
1.3 - Blue Water Scarcity (score)	1.56	The blue water scarcity risk indicator is based on Mekonnen and Hoekstra (2016) global assessment of blue water scarcity on a monthly basis and at high spatial resolution (grid cells of 30 × 30 arc min resolution). Blue water scarcity is calculated as the ratio of the blue water footprint in a grid cell to the total blue water availability in the cell. The time period analyzed in this study ranges from 1996 to 2005.	Mekonnen, M. M., & Hoekstra, A. Y. (2016). Four billion people facing severe water scarcity. Science advances, 2(2), e1500323.
1.3 - Blue Water Scarcity (rank)	140	The blue water scarcity risk indicator is based on Mekonnen and Hoekstra (2016) global assessment of blue water scarcity on a monthly basis and at high spatial resolution (grid cells of 30 × 30 arc min resolution). Blue water scarcity is calculated as the ratio of the blue water footprint in a grid cell to the total blue water availability in the cell. The time period analyzed in this study ranges from 1996 to 2005.	Mekonnen, M. M., & Hoekstra, A. Y. (2016). Four billion people facing severe water scarcity. Science advances, 2(2), e1500323.
1.4 - Projected Change in Water Discharge (by ~2050) (score)	3.00	This risk indicator is based on multi-model simulation that applies both global climate and hydrological models from the Inter-Sectoral Impact Model Intercomparison Project (ISIMIP). To estimate the change at 2°C of global warming above 1980-2010 levels, simulated annual water discharge was averaged over a 31-year period with 2°C mean warming. Results are expressed in terms of relative change (%) in probability between present day (1980-2010) conditions and 2°C scenarios by 2050.	Schewe, J., Heinke, J., Gerten, D., Haddeland, I., Arnell, N. W., Clark, D. B., ... & Gosling, S. N. (2014). Multimodel assessment of water scarcity under climate change. Proceedings of the National Academy of Sciences, 111(9), 3245-3250.
1.4 - Projected Change in Water Discharge (by ~2050) (rank)	22	This risk indicator is based on multi-model simulation that applies both global climate and hydrological models from the Inter-Sectoral Impact Model Intercomparison Project (ISIMIP). To estimate the change at 2°C of global warming above 1980-2010 levels, simulated annual water discharge was averaged over a 31-year period with 2°C mean warming. Results are expressed in terms of relative change (%) in probability between present day (1980-2010) conditions and 2°C scenarios by 2050.	Schewe, J., Heinke, J., Gerten, D., Haddeland, I., Arnell, N. W., Clark, D. B., ... & Gosling, S. N. (2014). Multimodel assessment of water scarcity under climate change. Proceedings of the National Academy of Sciences, 111(9), 3245-3250.

Country Overview - Romania

Indicator	Value	Description	Source
1.5 - Drought Frequency Probability (score)	1.87	This risk indicator is based on the Standardized Precipitation and Evaporation Index (SPEI). Vicente-Serrano et al. (2010) developed this multi-scalar drought index applying both precipitation and temperature data to detect, monitor and analyze different drought types and impacts in the context of global warming. The mathematical calculations used for SPEI are similar to the Standard Precipitation Index (SPI), but it has the advantage to include the role of evapotranspiration.	Vicente-Serrano, S. M., Beguería, S., & López-Moreno, J. I. (2010). A multiscalar drought index sensitive to global warming: the standardized precipitation evapotranspiration index. <i>Journal of climate</i> , 23(7), 1696-1718.
1.5 - Drought Frequency Probability (rank)	155	This risk indicator is based on the Standardized Precipitation and Evaporation Index (SPEI). Vicente-Serrano et al. (2010) developed this multi-scalar drought index applying both precipitation and temperature data to detect, monitor and analyze different drought types and impacts in the context of global warming. The mathematical calculations used for SPEI are similar to the Standard Precipitation Index (SPI), but it has the advantage to include the role of evapotranspiration.	Vicente-Serrano, S. M., Beguería, S., & López-Moreno, J. I. (2010). A multiscalar drought index sensitive to global warming: the standardized precipitation evapotranspiration index. <i>Journal of climate</i> , 23(7), 1696-1718.
1.6 - Projected Change in Drought Occurrence (by ~2050) (score)	3.30	This risk indicator is based on multi-model simulation that applies both global climate and drought models from the Inter-Sectoral Impact Model Intercomparison Project (ISIMIP) . A drought threshold for pre-industrial conditions was calculated based on time-series averages. Results are expressed in terms of relative change (%) in probability between pre-industrial and 2°C scenarios.	Frieler, K., Lange, S., Piontek, F., Reyer, C. P., Schewe, J., Warszawski, L., ... & Geiger, T. (2017). Assessing the impacts of 1.5 C global warming-simulation protocol of the Inter-Sectoral Impact Model Intercomparison Project (ISIMIP2b). <i>Geoscientific Model Development</i> .
1.6 - Projected Change in Drought Occurrence (by ~2050) (rank)	34	This risk indicator is based on multi-model simulation that applies both global climate and drought models from the Inter-Sectoral Impact Model Intercomparison Project (ISIMIP) . A drought threshold for pre-industrial conditions was calculated based on time-series averages. Results are expressed in terms of relative change (%) in probability between pre-industrial and 2°C scenarios.	Frieler, K., Lange, S., Piontek, F., Reyer, C. P., Schewe, J., Warszawski, L., ... & Geiger, T. (2017). Assessing the impacts of 1.5 C global warming-simulation protocol of the Inter-Sectoral Impact Model Intercomparison Project (ISIMIP2b). <i>Geoscientific Model Development</i> .
2.1 - Estimated Flood Occurrence (score)	4.18	This risk indicator is based on the recurrence of floods within the 34-year time frame period of 1985 to 2019. The occurrence of floods within a given location was estimated using data from Flood Observatory, University of Colorado. The Flood Observatory use data derived from a wide variety of news, governmental, instrumental, and remote sensing source.	Brakenridge, G. R. (2019). Global active archive of large flood events. Dartmouth Flood Observatory, University of Colorado.
2.1 - Estimated Flood Occurrence (rank)	22	This risk indicator is based on the recurrence of floods within the 34-year time frame period of 1985 to 2019. The occurrence of floods within a given location was estimated using data from Flood Observatory, University of Colorado. The Flood Observatory use data derived from a wide variety of news, governmental, instrumental, and remote sensing source.	Brakenridge, G. R. (2019). Global active archive of large flood events. Dartmouth Flood Observatory, University of Colorado.

Indicator	Value	Description	Source
2.2 - Projected Change in Flood Occurrence (by ~2050) (score)	1.00	This risk indicator is based on multi-model simulation that applies both global climate and drought models from the Inter-Sectoral Impact Model Intercomparison Project (ISIMIP). The magnitude of the flood event was defined based on 100-year return period for pre-industrial conditions. Results are expressed in terms of change (%) in probability between pre-industrial and 2°C scenarios.	Frieler, K., Lange, S., Piontek, F., Reyer, C. P., Schewe, J., Warszawski, L., ... & Geiger, T. (2017). Assessing the impacts of 1.5 C global warming-simulation protocol of the Inter-Sectoral Impact Model Intercomparison Project (ISIMIP2b). Geoscientific Model Development.
2.2 - Projected Change in Flood Occurrence (by ~2050) (rank)	192	This risk indicator is based on multi-model simulation that applies both global climate and drought models from the Inter-Sectoral Impact Model Intercomparison Project (ISIMIP). The magnitude of the flood event was defined based on 100-year return period for pre-industrial conditions. Results are expressed in terms of change (%) in probability between pre-industrial and 2°C scenarios.	Frieler, K., Lange, S., Piontek, F., Reyer, C. P., Schewe, J., Warszawski, L., ... & Geiger, T. (2017). Assessing the impacts of 1.5 C global warming-simulation protocol of the Inter-Sectoral Impact Model Intercomparison Project (ISIMIP2b). Geoscientific Model Development.
3.1 - Surface Water Contamination Index (score)	3.79	<p>The underlying data for this risk indicator is based on a broad suite of pollutants with well-documented direct or indirect negative effects on water security for both humans and freshwater biodiversity, compiled by Vörösmarty et al. (2010). The negative effects are specific to individual pollutants, ranging from impacts mediated by eutrophication such as algal blooms and oxygen depletion (e.g., caused by phosphorus and organic loading) to direct toxic effects (e.g., caused by pesticides, mercury).</p> <p>The overall Surface Water Contamination Index is calculated based on a range of key pollutants with different weightings according to the level of their negative effects on water security for both humans and freshwater biodiversity: soil salinization (8%), nitrogen (12%) and phosphorus (P, 13%) loading, mercury deposition (5%), pesticide loading (10%), sediment loading (17%), organic loading (as Biological Oxygen Demand, BOD; 15%), potential acidification (9%), and thermal alteration (11%).</p>	Vörösmarty, C. J., McIntyre, P. B., Gessner, M. O., Dudgeon, D., Prusevich, A., Green, P., ... & Davies, P. M. (2010). Global threats to human water security and river biodiversity. Nature, 467(7315), 555.

4.1 - Fragmentation Status of Rivers (score)	4.08	This risk indicator is based on the data set by Grill et al. (2019) mapping the world's free-flowing rivers. Grill et al. (2019) compiled a geometric network of the global river system and associated attributes, such as hydro-geometric properties, as well as pressure indicators to calculate an integrated connectivity status index (CSI). While only rivers with high levels of connectivity in their entire length are classified as free-flowing, rivers of CSI < 95% are considered as fragmented at a certain degree.	Grill, G., Lehner, B., Thieme, M., Geenen, B., Tickner, D., Antonelli, F., ... & Macedo, H. E. (2019). Mapping the world's free-flowing rivers. <i>Nature</i> , 569(7755), 215.
4.1 - Fragmentation Status of Rivers (rank)	11	This risk indicator is based on the data set by Grill et al. (2019) mapping the world's free-flowing rivers. Grill et al. (2019) compiled a geometric network of the global river system and associated attributes, such as hydro-geometric properties, as well as pressure indicators to calculate an integrated connectivity status index (CSI). While only rivers with high levels of connectivity in their entire length are classified as free-flowing, rivers of CSI < 95% are considered as fragmented at a certain degree.	Grill, G., Lehner, B., Thieme, M., Geenen, B., Tickner, D., Antonelli, F., ... & Macedo, H. E. (2019). Mapping the world's free-flowing rivers. <i>Nature</i> , 569(7755), 215.
4.2 - Catchment Ecosystem Services Degradation Level (tree cover loss) (score)	2.05	<p>For this risk indicator, tree cover loss was applied as a proxy to represent catchment ecosystem services degradation since forests play an important role in terms of water regulation, supply and pollution control.</p> <p>The forest cover data is based on Hansen et al.'s global Landsat data at a 30-meter spatial resolution to characterize forest cover and change. The authors defined trees as vegetation taller than 5 meters in height, and forest cover loss as a stand-replacement disturbance, or a change from a forest to non-forest state, during the period 2000 – 2018.</p>	Hansen, M. C., Potapov, P. V., Moore, R., Hancher, M., Turubanova, S. A. A., Tyukavina, A., ... & Kommareddy, A. (2013). High-resolution global maps of 21st-century forest cover change. <i>science</i> , 342(6160), 850-853.

Country Overview - Romania

Indicator	Value	Description	Source
4.2 - Catchment Ecosystem Services Degradation Level (tree cover loss) (rank)	89	For this risk indicator, tree cover loss was applied as a proxy to represent catchment ecosystem services degradation since forests play an important role in terms of water regulation, supply and pollution control. The forest cover data is based on Hansen et al.'s global Landsat data at a 30-meter spatial resolution to characterize forest cover and change. The authors defined trees as vegetation taller than 5 meters in height, and forest cover loss as a stand-replacement disturbance, or a change from a forest to non-forest state, during the period 2000 – 2018.	Hansen, M. C., Potapov, P. V., Moore, R., Hancher, M., Turubanova, S. A. A., Tyukavina, A., ... & Kommareddy, A. (2013). High-resolution global maps of 21st-century forest cover change. <i>science</i> , 342(6160), 850-853.
4.3 - Projected Impacts on Freshwater Biodiversity (score)	4.02	The study by Tedesco et al. (2013) to project changes [% increase or decrease] in extinction rate by ~2090 of freshwater fish due to water availability loss from climate change is used as a proxy to estimate the projected impacts on freshwater biodiversity.	Tedesco, P. A., Oberdorff, T., Cornu, J. F., Beauchard, O., Brosse, S., Dürr, H. H., ... & Hugueny, B. (2013). A scenario for impacts of water availability loss due to climate change on riverine fish extinction rates. <i>Journal of Applied Ecology</i> , 50(5), 1105-1115.
4.3 - Projected Impacts on Freshwater Biodiversity (rank)	27	The study by Tedesco et al. (2013) to project changes [% increase or decrease] in extinction rate by ~2090 of freshwater fish due to water availability loss from climate change is used as a proxy to estimate the projected impacts on freshwater biodiversity.	Tedesco, P. A., Oberdorff, T., Cornu, J. F., Beauchard, O., Brosse, S., Dürr, H. H., ... & Hugueny, B. (2013). A scenario for impacts of water availability loss due to climate change on riverine fish extinction rates. <i>Journal of Applied Ecology</i> , 50(5), 1105-1115.
5.1 - Freshwater Policy Status (SDG 6.5.1) (score)	1.00	This risk indicator is based on SDG 6.5.1. Degree of IWRM Implementation "National Water Resources Policy" indicator, which corresponds to one of the three national level indicators under the Enabling Environment category.	UN Environment (2018). Progress on integrated water resources management. Global baseline for SDG 6 Indicator 6.5.1: degree of IWRM implementation.
5.1 - Freshwater Policy Status (SDG 6.5.1) (rank)	172	This risk indicator is based on SDG 6.5.1. Degree of IWRM Implementation "National Water Resources Policy" indicator, which corresponds to one of the three national level indicators under the Enabling Environment category.	UN Environment (2018). Progress on integrated water resources management. Global baseline for SDG 6 Indicator 6.5.1: degree of IWRM implementation.
5.2 - Freshwater Law Status (SDG 6.5.1) (score)	1.00	This risk indicator is based on SDG 6.5.1. Degree of IWRM Implementation "National Water Resources Law(s)" indicator, which corresponds to one of the three national level indicators under the Enabling Environment category. For SDG 6.5.1, enabling environment depicts the conditions that help to support the implementation of IWRM, which includes legal and strategic planning tools for IWRM.	UN Environment (2018). Progress on integrated water resources management. Global baseline for SDG 6 Indicator 6.5.1: degree of IWRM implementation.

Country Overview - Romania

Indicator	Value	Description	Source
5.2 - Freshwater Law Status (SDG 6.5.1) (rank)	163	<p>This risk indicator is based on SDG 6.5.1. Degree of IWRM Implementation “National Water Resources Law(s)” indicator, which corresponds to one of the three national level indicators under the Enabling Environment category.</p> <p>For SDG 6.5.1, enabling environment depicts the conditions that help to support the implementation of IWRM, which includes legal and strategic planning tools for IWRM.</p>	UN Environment (2018). Indicator	Value	Description	Source
7.2 - Groundwater Monitoring Data Availability and Management (score)	3.00	This risk indicator is based on the data set by UN IGRAC (2019) to determine the level of availability of groundwater monitoring data at country level as groundwater management decisions rely strongly on data availability. The level of groundwater monitoring data availability for groundwater management is determined according to a combination of three criteria developed by WWF and IGRAC: 1) Status of country groundwater monitoring programme, 2) groundwater data availability for NGOs and 3) Public access to processed groundwater monitoring data.	UN IGRAC (2019). Global Groundwater Monitoring Network GGMN Portal. UN International Groundwater Resources Assessment Centre (IGRAC).
7.2 - Groundwater Monitoring Data Availability and Management (rank)	83	This risk indicator is based on the data set by UN IGRAC (2019) to determine the level of availability of groundwater monitoring data at country level as groundwater management decisions rely strongly on data availability. The level of groundwater monitoring data availability for groundwater management is determined according to a combination of three criteria developed by WWF and IGRAC: 1) Status of country groundwater monitoring programme, 2) groundwater data availability for NGOs and 3) Public access to processed groundwater monitoring data.	UN IGRAC (2019). Global Groundwater Monitoring Network GGMN Portal. UN International Groundwater Resources Assessment Centre (IGRAC).
7.3 - Density of Runoff Monitoring Stations (score)	2.04	The density of monitoring stations for water quantity was applied as proxy to develop this risk indicator. The Global Runoff Data Base was used to estimate the number of monitoring stations per 1000km2 of the main river system (data base access date: May 2018).	BfG (2019). Global Runoff Data Base. German Federal Institute of Hydrology (BfG).
7.3 - Density of Runoff Monitoring Stations (rank)	170	The density of monitoring stations for water quantity was applied as proxy to develop this risk indicator. The Global Runoff Data Base was used to estimate the number of monitoring stations per 1000km2 of the main river system (data base access date: May 2018).	BfG (2019). Global Runoff Data Base. German Federal Institute of Hydrology (BfG).
8.1 - Access to Safe Drinking Water (score)	1.00	This risk indicator is based on the Joint Monitoring Programme for Water Supply, Sanitation and Hygiene (UNICEF/WHO) 2019 data. It provides estimates on the use of water, sanitation and hygiene by country for the period 2000-2017.	WHO & UNICEF (2019). Estimates on the use of water, sanitation and hygiene by country (2000-2017). Joint Monitoring Programme for Water Supply, Sanitation and Hygiene.
8.1 - Access to Safe Drinking Water (rank)	132	This risk indicator is based on the Joint Monitoring Programme for Water Supply, Sanitation and Hygiene (UNICEF/WHO) 2019 data. It provides estimates on the use of water, sanitation and hygiene by country for the period 2000-2017.	WHO & UNICEF (2019). Estimates on the use of water, sanitation and hygiene by country (2000-2017). Joint Monitoring Programme for Water Supply, Sanitation and Hygiene.
8.2 - Access to Sanitation (score)	3.00	This risk indicator is based on the Joint Monitoring Programme for Water Supply, Sanitation and Hygiene (UNICEF/WHO) 2019 data. It provides estimates on the use of water, sanitation and hygiene by country for the period 2000-2017.	WHO & UNICEF (2019). Estimates on the use of water, sanitation and hygiene by country (2000-2017). Joint Monitoring Programme for Water Supply, Sanitation and Hygiene.

8.2 - Access to Sanitation (rank)	82	This risk indicator is based on the Joint Monitoring Programme for Water Supply, Sanitation and Hygiene (UNICEF/WHO) 2019 data. It provides estimates on the use of water, sanitation and hygiene by country for the period 2000-2017.	WHO & UNICEF (2019). Estimates on the use of water, sanitation and hygiene by country (2000-2017). Joint Monitoring Programme for Water Supply, Sanitation and Hygiene.
8.3 - Financing for Water Resource Development and Management (SDG 6.5.1) (score)	3.00	This risk indicator is based on the average 'Financing' score of UN SDG 6.5.1. Degree of IWRM Implementation database. UN SDG 6.5.1 database contains a category on financing which assesses different aspects related to budgeting and financing made available and used for water resources development and management from various sources.	UN Environment (2018). Progress on integrated water resources management. Global baseline for SDG 6 Indicator 6.5.1: degree of IWRM implementation.
8.3 - Financing for Water Resource Development and Management (SDG 6.5.1) (rank)	104	This risk indicator is based on the average 'Financing' score of UN SDG 6.5.1. Degree of IWRM Implementation database. UN SDG 6.5.1 database contains a category on financing which assesses different aspects related to budgeting and financing made available and used for water resources development and management from various sources.	UN Environment (2018). Progress on integrated water resources management. Global baseline for SDG 6 Indicator 6.5.1: degree of IWRM implementation.
9.1 - Cultural Diversity (score)	1.00	Water is a social and cultural good. The cultural diversity risk indicator was included in order to acknowledge that businesses face reputational risk due to the importance of freshwater for indigenous and traditional people in their daily life, religion and culture. This risk indicator is based on Oviedo and Larsen (2000) data set, which mapped the world's ethnolinguistic groups onto the WWF map of the world's ecoregions. This cross-mapping showed for the very first time the significant overlap that exists between the global geographic distribution of biodiversity and that of linguistic diversity.	Oviedo, G., Maffi, L., & Larsen, P. B. (2000). Indigenous and traditional peoples of the world and ecoregion conservation: An integrated approach to conserving the world's biological and cultural diversity. Gland: WWF (World Wide Fund for Nature) International.
9.1 - Cultural Diversity (rank)	160	Water is a social and cultural good. Country Aspects

1. PHYSICAL ASPECTS

1.1. WATER RESOURCES

1.1.1. WATER RESOURCES

The Danube is of huge significance to Romania: covering 237,391km² and with nearly 22 million inhabitants, the country is almost entirely within the Danube basin. Almost a third of the surface area of the basin is in Romania, and over a third of the river's length flows through the country. Crucially, the Romanian (and Ukrainian) Danube is the end carrier of all wastewater discharges from all countries into the Black Sea. Over half of Romania's water bodies show high ecological status. However, development significantly affected water quality in much of the rest in the 1960s to 1980s.

Romania is poor in water resources, with 1,700m³/inhabitant/yr, ranking it 13th in Europe. Specific mean flow is under 1L/s/km² on the Romanian, Dobrogea, Timis and Arad plains and 40L/s/km² in the high zones of the Fagaras and Retezat mountains. The river network is 78,905km in total. 6.1 per cent of Romania (14,437.3km²) has been designated for the protection of habitats/species. Romania's water resources comprise the Danube (44 per cent), inland rivers (46 per cent) and groundwater (10 per cent).

1.1.2. WATER USE

Water demand in the industrial and agricultural sectors increased continuously until 1989. After this, demand decreased in parallel with the increase in the quantity of water used by households. Water quality improved slightly because of lower agricultural and industrial pollution and the measures imposed on economic agents by the local environmental protection agency.

The percentage of top quality watercourses grew from 35 per cent in 1985 to approximately 66 per cent in 2002. Nevertheless, some 6.6 per cent of watercourses still remained below the quality needed for aquatic fauna to develop.

There are no specific statistics about the efficiency of water use in industry. There are water recycling systems treating 10-95 per cent of water, depending on the industry and individual factories. In agriculture, most water is used for irrigation, where water efficiency ranges from 60 to 80 per cent. Average water consumption per capita per day in urban areas is about 513L. Around 294L of this is for domestic use; 70L for public use; 122L for economic activities use; and 134L is lost in the network. Water consumption is approximately 150L per capita per day in rural areas.

Reducing water losses is important. On average, at the national level, losses will decrease from 34 per cent at present to 15 per cent by 2020. Introduction of real water prices will present an incentive to reduce losses and to increase recirculation and re-use. Low investment and slow

application of reforms in the national economy have the potential to slow down this process. Irrigation water is subject to monitoring and evaluation before the irrigation period. However, no data from this monitoring is available at national level.

According to the 1992 census, 85 per cent of the urban population and 16 per cent of the rural population live in households connected to water supply systems. More recent information shows a 93 per cent increase in access to the centralized drinking water system in cities and a 17 per cent increase in rural areas.

In 2005, 7.8 billion m³ was abstracted in Romania for human use. River systems are used for: hydroelectric power (29 per cent of the country's power supply); navigation; to receive effluent; and to provide the majority of Romania's drinking water supply. Flooding is a problem, exacerbated by heavy localized rainfall, increased urban land use, ad hoc floodplain development, reduced riverbed capacity and non-rational deforestation of large areas. Hydro-morphological pressures affect a large proportion of watercourses. Significant pressures come from reservoirs (there are 255 in Romania); embankments (80 per cent of the Danube is embanked); regulation works (stretching 6,600km); water diversions; 138 significant water abstractions; and 147 significant water restitutions.

1.2. WATER QUALITY, ECOSYSTEMS AND HUMAN HEALTH

Major environmental problems in Romania include: soil erosion and degradation; water pollution; air pollution in the south from industrial effluents; and contamination of Danube Delta wetlands.

According to Ministerial Order 768/2000 from the Minister of Health, water monitoring results should be gathered in an annual report on water quality in urban areas. The 2000 version of this report, covering 257 municipalities encompassing 51 per cent of Romania's total population, revealed:

- Around 14.7 million inhabitants (65 per cent of the total population) are connected to a public water supply system; 11.3 million of these live in urban areas (around 90 per cent of the total urban population) and 3.4 million in rural areas (around 33 per cent of the total rural population);

- Three per cent of water samples taken exceeded the safe limits for total coliforms and 1 per cent exceeded the limits for fecal coliforms. Between 3 and 5 per cent exceeded the limits for chemical parameters.

Agriculture (animal farms) causes most water pollution from methane (CH₄) nitrogen dioxide (NO₂) and ammonia (NH₃: over 95 per cent). Water pollution in the upstream part of the Danube is increasing.

Water available to most of the rural population with no access to centralized drinking water supply systems comes from about 1 million wells, mostly shallow (5-20m deep) and susceptible to contamination. Close to 19 per cent of surface water sources and 10 per cent of groundwater sources used for drinking water extraction have had no sanitary protection (data from 1991-95).

Registered incidence of diarrhoea diseases decreased from 414 cases per 100,000 people in 1990 to 339 per 100,000 in 1997, but increased in more recent years (to 361 per 100,000 in 1999).

Fifty-seven per cent of Romanian water bodies, particularly in mountainous areas, remain undisturbed by major anthropogenic pressure. However, economic development between 1960 and 1989 resulted in a significant worsening of the water quality of the Danube and inland rivers. This has since improved (due to reduced development and new regulations) but quality remains inferior to the 1950s.

Of the 2,609 settlements with 2,000+ people equivalents (PE), 17 per cent have sewage systems; 263 settlements of 10,000+ PE require systems with nutrient removal. 51.1 per cent of the population is linked to wastewater collection systems and 27.3 per cent to treatment plants. However, in rural areas, only 4.1 per cent is connected to sewerage systems; rural wastewater management is the major challenge for the coming years. Navigation puts significant pressure on the Danube; of 455 incidents involving shipping reported from 1983 to 2003, 30 resulted in serious water pollution.

In 2004, 13,034 tonnes of nitrogen (N) and 3,399 tonnes of phosphorus (P) were released into Romania's waters, 98 per cent and 85 per cent of which respectively derive from settlements. Agro-chemical fertilizers are the main source of diffuse discharges. With regard to priority substances, 582 industrial units have been inventoried as discharging dangerous substances into water resources/sewage systems (2001 data).

The status of the Danube River, Delta and Romania's coastal waters depends considerably on pollutants from upstream countries (particularly for N and P loads). Diffuse agricultural sources, especially chemical fertilizer use in upstream countries and badly operated wastewater treatment plants in Central and Eastern Europe, are a major input.

2. GOVERNANCE ASPECTS

2.1. WATER INSTITUTIONS

Romania must try to incorporate the philosophy of sustainable development into all its national and local development strategies to cope with the requirements of, and fit into, the complex world we live in today. According to the Law on Environmental Protection No. 137/1995, republished, each ministry is obliged to establish its own environmental management and develop relevant environmental strategies. In this respect, the Ministry of Environment and Water Management acts as a supervising authority.

The Ministry of Environment and Water Management (MEWM) manages overall sustainable development. A special law, not yet functioning, set up a National Council for Environment and Sustainable Development. All central public administration authorities are represented on this council.

MEWM deals with national water strategy and policy in the water resources quantitative and qualitative management field.

The specific functions of the ministry include: strategic planning, including the elaboration of water

management and development national programmes; preparation of legislation and policy; responsibilities for transposing and implementing EU legislation; allocation and management of national budget resources for water management and development; preparation of administrative processes for regulated use of water resources through the system of licence and permits; and international cooperation on transboundary water bodies.

The National Administration (NARW, "Apele Române") implements national water strategy and policy, carries out quantitative and qualitative water management and operates the water management structures. It has 11 regional branches organized according to hydrographic river basins. NARW has responsibilities for issuing licences and permits and for monitoring water quality and emissions.

2.2. WATER MANAGEMENT

In Romania water management is based on the principle of human solidarity and common interest through close collaboration and cooperation between the public administration, water users and representatives of local communities.

Each river branch of the "Apele Române" has a Basin Committee, consisting of 15 members.

Water users are obliged to prepare and apply, if necessary, their own plans for prevention and control of accidental pollution that might occur as the result of their activity.

There is a unitary economic mechanism for water management products and services, which consists of prices, tariff, penalties and allowances (bonus) – water charges. This aims to promote rational and economical management of water with users adhering to quality limits to prevent the exhaustion of water resources and damaging its quality. Prices are the same all over Romania, but differ according to the source of water (inland rivers, Danube River, groundwater) and the category of users (industry, households, power plant, agriculture, fisheries). Penalties are levied for non-compliance with limits, permits or contracts, both for water intake and wastewater discharge. Penalties go to the Fund for Environmental Water Management.

Income from water charges is used to cover "Apele Române's" costs of operation. Consumers pay for drinking water, supplied by the municipal water supply systems. Tariffs for water supply and sewerage services differ between municipalities. Water Law no. 107 of 1996 and Emergency Ordinance 107/2002 approved through the Law 404/2003 deal with pricing policy for all sectors.

"Apele Române" is responsible for the application of specific economical mechanisms in quantitative and qualitative water management; the complex valuation of waters as an economic resource; rational and balanced distribution of water; carrying out specific water management services on a contract basis; proposals for water management services tariffs; and updating itself according to the current legislation.

Romania has transposed the EU legislation covered by the Aquis Communautaire, including the Water Quality Directives and Water Framework Directive. A key problem is to obtain derogation periods for those directives that call for "heavy investments".

Commissions operate at the national and local level as specified in the Law for Natural Disaster Preparedness no. 124 of 1995 to deal with disaster preparedness

2.3. WATER POLICY AND LEGAL FRAMEWORK

The general legislation and regulatory framework for water management is the Environmental Protection Law no. 137 of 1995 and the Water Law no. 107 of 1996. The Environmental Protection Law has general provisions related to water resources protection and establishes the regulation of economic and social activities with an environmental impact.

The Water Law is the fundamental legal act on water management in Romania. This law covers all waters bodies excluding mineral and geothermal waters. The law states that water is the integral part of public patrimony. The protection, revaluation and sustainable development of water resources are actions of general interest. The law has established the ownership of water, keeping the major water assets as public domain.

The provisions of the law have the following objectives:

- The conservation, development and protection of water resources, as well as ensuring free water flow;
- Protection against any form of pollution and modification of the characteristics of water resources, of their banks and beds or basins;
- Restoration of surface and groundwater quality;
- Conservation and protection of the aquatic ecosystems;
- Ensuring drinking water supply for the population and public sanitation;
- The complex valuation of waters as an economic resource and rational and balanced distribution of such resource;
- Prevention and control of floods and of any other dangerous hydro-meteorological phenomena;
- Ensuring water requirements for agriculture, industry, power generation, transport, aquaculture, tourism, recreation and human activities.

The 1996 Water Law also establishes the river basins management concept to manage both surface and groundwater. Any water use is dependent on getting a licence and permit. Licences are also needed for wastewater discharge into water bodies. The law also states that water supply for the population prevails over water use for others purposes. The law provides for establishing protection zones if needed.

The Water Law 107/96 will be amended to transpose the provisions of the Water Framework Directive 2000/60/EC. MWEM proposed the amendments and they are under discussion with other relevant ministries.

The details of “water resource use regime”, standards, norms, etc. according to the Romanian legislation system have to be set up by Governmental Decisions or Ministerial Orders. The most important pieces of secondary legislation introduced by transposing EU directives related to water are:

- GD 964/2000 concerning the approval of an action plan for the protection of waters against nitrates from agriculture sources;
- GD 459/2002 concerning the quality of bathing water;
- Law 458/2002 concerning the quality of drinking water;

-GD 118/2002 concerning the approval of the action programme to reduce pollution of the aquatic environment and groundwater caused by certain dangerous substances;

-GD 202/2002 for the approval of the technical norms for the quality of fresh water needing protection or improvement to support fish life;

-GD 201/2002 for the approval of the technical norms for the quality of shellfish waters;

-GD 188/2002 on the approval NTPA 011, 001 and 002 regarding the discharging conditions of urban wastewater into the aquatic environment;

-GD 100/2002 for the approval of the technical norms for the quality of surface water intended for abstraction for drinking water, NTPA 013, and of the norms concerning the methods of measurement and frequencies of sampling and analysis of surface water intended for the abstraction of drinking water NTPA 014.

3. GEOPOLITICAL ASPECTS

Romania is involved in a number of initiatives, such as

- Pilot programme on transboundary waters to the 1992 Convention on protection and use of transboundary watercourses and international lakes;
- Programmes for the implementation of the EU Directives in the water field (mainly the Water framework Directive);
- Black Sea GEF Programme; PHARE Regional River Management Project and Delta ECO Activities Project - collaboration with the EU.

See also under G. Impacts of Climate Change on Water Resources. Pilot project “Guidelines on monitoring and assessment of Mures transboundary river (Romania -Hungary)” is being implemented.

Some hydro-technical projects are co-funded through grants from the PHARE-Cross Border Cooperation programme, such as in the Cris, Tisza, Tur, and Barcau river basins. To address the problem of eutrophication in the Black Sea, two GEF-UNDP project proposals on nutrient reduction measures (for the Danube and Black Sea basins) are pending.

GEF-World Bank is currently supporting an agricultural pollution control project in the area of Calarasi, to reduce nitrate inputs into the Danube and the Black Sea.
