

# Water Indicators

Indicator	Value	Description	Source
Overall Basin Risk (score)	2.92	Overall Basin Risk (score)	
Overall Basin Risk (rank)	40	Overall Basin Risk (rank)	
Physical risk (score)	3.20	Physical risk (score)	
Physical risk (rank)	29	Physical risk (rank)	
Regulatory risk (score)	3.05	Regulatory risk (score)	
Regulatory risk (rank)	60	Regulatory risk (rank)	
Reputation risk (score)	1.96	Reputation risk (score)	
Reputation risk (rank)	189	Reputation risk (rank)	
1. Quantity - Scarcity (score)	3.86	1. Quantity - Scarcity (score)	
1. Quantity - Scarcity (rank)	15	1. Quantity - Scarcity (rank)	
2. Quantity - Flooding (score)	1.43	2. Quantity - Flooding (score)	
2. Quantity - Flooding (rank)	183	2. Quantity - Flooding (rank)	
3. Quality (score)	3.91	3. Quality (score)	
3. Quality (rank)	30	3. Quality (rank)	
4. Ecosystem Service Status (score)	2.53	4. Ecosystem Service Status (score)	
4. Ecosystem Service Status (rank)	91	4. Ecosystem Service Status (rank)	
5. Enabling Environment (Policy & Laws) (score)	3.00	5. Enabling Environment (Policy & Laws) (score)	
5. Enabling Environment (Policy & Laws) (rank)	66	5. Enabling Environment (Policy & Laws) (rank)	
6. Institutions and Governance (score)	4.00	6. Institutions and Governance (score)	
6. Institutions and Governance (rank)	27	6. Institutions and Governance (rank)	
7. Management Instruments (score)	3.08	7. Management Instruments (score)	
7. Management Instruments (rank)	66	7. Management Instruments (rank)	
8 - Infrastructure & Finance (score)	1.20	8 - Infrastructure & Finance (score)	
8 - Infrastructure & Finance (rank)	138	8 - Infrastructure & Finance (rank)	
9. Cultural Diversity (score)	1.00	9. Cultural importance (score)	
9. Cultural Diversity (rank)	135	9. Cultural importance (rank)	
10. Biodiversity Importance (score)	1.68	10. Biodiversity importance (score)	

Indicator	Value	Description	Source
10. Biodiversity Importance (rank)	191	10. Biodiversity importance (rank)	
11. Media Scrutiny (score)	2.10	11. Media Scrutiny (score)	
11. Media Scrutiny (rank)	156	11. Media Scrutiny (rank)	
12. Conflict (score)	2.37	12. Conflict (score)	
12. Conflict (rank)	114	12. Conflict (rank)	
1.0 - Aridity (score)	3.95	The aridity risk indicator is based on the Global Aridity Index (Global- Aridity) and Global Potential Evapo-Transpiration (Global-PET) Geospatial data sets by Trabucco and Zomer (2009). These data sets provide information about the potential availability of water in regions with low water demand, thus they are used in the Water Risk Filter 5.0 to better account for deserts and other arid areas in the risk assessment.	Trabucco, A., & Zomer, R. J. (2009). Global potential evapo-transpiration (Global-PET) and global aridity index (Global-Aridity) geo- database. CGIAR consortium for spatial information.
1.0 - Aridity (rank)	18	The aridity risk indicator is based on the Global Aridity Index (Global- Aridity) and Global Potential Evapo-Transpiration (Global-PET) Geospatial data sets by Trabucco and Zomer (2009). These data sets provide information about the potential availability of water in regions with low water demand, thus they are used in the Water Risk Filter 5.0 to better account for deserts and other arid areas in the risk assessment.	Trabucco, A., & Zomer, R. J. (2009). Global potential evapo-transpiration (Global-PET) and global aridity index (Global-Aridity) geo- database. CGIAR consortium for spatial information.
1.1 - Water Depletion (score)	3.63	The water depletion risk indicator is based on annual average monthly net water depletion from Brauman et al. (2016). Their analysis is based on model outputs from the newest version of the integrated water resources model WaterGAP3 which measures water depletion as the ratio of water consumption-to-availability.	Brauman, K. A., Richter, B. D., Postel, S., Malsy, M., & Flörke, M. (2016). Water depletion: An improved metric for incorporating seasonal and dry-year water scarcity into water risk assessments. Elem Sci Anth, 4.
1.1 - Water Depletion (rank)	12	The water depletion risk indicator is based on annual average monthly net water depletion from Brauman et al. (2016). Their analysis is based on model outputs from the newest version of the integrated water resources model WaterGAP3 which measures water depletion as the ratio of water consumption-to-availability.	Brauman, K. A., Richter, B. D., Postel, S., Malsy, M., & Flörke, M. (2016). Water depletion: An improved metric for incorporating seasonal and dry-year water scarcity into water risk assessments. Elem Sci Anth, 4.
1.2 - Baseline Water Stress (score)	3.92	World Resources Institute's Baseline Water Stress measures the ratio of total annual water withdrawals to total available annual renewable supply, accounting for upstream consumptive use. A higher percentage indicates more competition among users.	Hofste, R., Kuzma, S., Walker, S., & Sutanudjaja, E.H. (2019). Aqueduct 3.0: Updated decision relevant global water risk indicators. Technical note. Washington, DC: World Resources Institute.

Indicator	Value	Description	Source
1.2 - Baseline Water Stress (rank)	19	World Resources Institute's Baseline Water Stress measures the ratio of total annual water withdrawals to total available annual renewable supply, accounting for upstream consumptive use. A higher percentage indicates more competition among users.	Hofste, R., Kuzma, S., Walker, S., & Sutanudjaja, E.H. (2019). Aqueduct 3.0: Updated decision relevant global water risk indicators. Technical note. Washington, DC: World Resources Institute.
1.3 - Blue Water Scarcity (score)	3.58	The blue water scarcity risk indicator is based on Mekonnen and Hoekstra (2016) global assessment of blue water scarcity on a monthly basis and at high spatial resolution (grid cells of 30 × 30 arc min resolution). Blue water scarcity is calculated as the ratio of the blue water footprint in a grid cell to the total blue water availability in the cell. The time period analyzed in this study ranges from 1996 to 2005.	Mekonnen, M. M., & Hoekstra, A. Y. (2016). Four billion people facing severe water scarcity. Science advances, 2(2), e1500323.
1.3 - Blue Water Scarcity (rank)	53	The blue water scarcity risk indicator is based on Mekonnen and Hoekstra (2016) global assessment of blue water scarcity on a monthly basis and at high spatial resolution (grid cells of 30 × 30 arc min resolution). Blue water scarcity is calculated as the ratio of the blue water footprint in a grid cell to the total blue water availability in the cell. The time period analyzed in this study ranges from 1996 to 2005.	Mekonnen, M. M., & Hoekstra, A. Y. (2016). Four billion people facing severe water scarcity. Science advances, 2(2), e1500323.
1.4 - Projected Change in Water Discharge (by ~2050) (score)	2.70	This risk indicator is based on multi-model simulation that applies both global climate and hydrological models from the Inter-Sectoral Impact Model Intercomparison Project (ISIMIP). To estimate the change at 2°C of global warming above 1980-2010 levels, simulated annual water discharge was averaged over a 31-year period with 2°C mean warming. Results are expressed in terms of relative change (%) in probability between present day (1980-2010) conditions and 2°C scenarios by 2050.	Schewe, J., Heinke, J., Gerten, D., Haddeland, I., Arnell, N. W., Clark, D. B., & Gosling, S. N. (2014). Multimodel assessment of water scarcity under climate change. Proceedings of the National Academy of Sciences, 111(9), 3245- 3250.
1.4 - Projected Change in Water Discharge (by ~2050) (rank)	34	This risk indicator is based on multi-model simulation that applies both global climate and hydrological models from the Inter-Sectoral Impact Model Intercomparison Project (ISIMIP). To estimate the change at 2°C of global warming above 1980-2010 levels, simulated annual water discharge was averaged over a 31-year period with 2°C mean warming. Results are expressed in terms of relative change (%) in probability between present day (1980-2010) conditions and 2°C scenarios by 2050.	Schewe, J., Heinke, J., Gerten, D., Haddeland, I., Arnell, N. W., Clark, D. B., & Gosling, S. N. (2014). Multimodel assessment of water scarcity under climate change. Proceedings of the National Academy of Sciences, 111(9), 3245- 3250.

Indicator	Value	Description	Source
1.5 - Drought Frequency Probability (score)	4.77	This risk indicator is based on the Standardized Precipitation and Evaporation Index (SPEI). Vicente-Serrano et al. (2010) developed this multi-scalar drought index applying both precipitation and temperature data to detect, monitor and analyze different drought types and impacts in the context of global warming. The mathematical calculations used for SPEI are similar to the Standard Precipitation Index (SPI), but it has the advantage to include the role of evapotranspiration.	Vicente-Serrano, S. M., Beguería, S., & López- Moreno, J. I. (2010). A multiscalar drought index sensitive to global warming: the standardized precipitation evapotranspiration index. Journal of climate, 23(7), 1696-1718.
1.5 - Drought Frequency Probability (rank)	14	This risk indicator is based on the Standardized Precipitation and Evaporation Index (SPEI). Vicente-Serrano et al. (2010) developed this multi-scalar drought index applying both precipitation and temperature data to detect, monitor and analyze different drought types and impacts in the context of global warming. The mathematical calculations used for SPEI are similar to the Standard Precipitation Index (SPI), but it has the advantage to include the role of evapotranspiration.	Vicente-Serrano, S. M., Beguería, S., & López- Moreno, J. I. (2010). A multiscalar drought index sensitive to global warming: the standardized precipitation evapotranspiration index. Journal of climate, 23(7), 1696-1718.
1.6 - Projected Change in Drought Occurrence (by ~2050) (score)	3.01	This risk indicator is based on multi-model simulation that applies both global climate and drought models from the Inter-Sectoral Impact Model Intercomparison Project (ISIMIP) . A drought threshold for pre-industrial conditions was calculated based on time-series averages. Results are expressed in terms of relative change (%) in probability between pre- industrial and 2°C scenarios.	Frieler, K., Lange, S., Piontek, F., Reyer, C. P., Schewe, J., Warszawski, L., & Geiger, T. (2017). Assessing the impacts of 1.5 C global warming–simulation protocol of the Inter- Sectoral Impact Model Intercomparison Project (ISIMIP2b). Geoscientific Model Development.
1.6 - Projected Change in Drought Occurrence (by ~2050) (rank)	62	This risk indicator is based on multi-model simulation that applies both global climate and drought models from the Inter-Sectoral Impact Model Intercomparison Project (ISIMIP) . A drought threshold for pre-industrial conditions was calculated based on time-series averages. Results are expressed in terms of relative change (%) in probability between pre- industrial and 2°C scenarios.	Frieler, K., Lange, S., Piontek, F., Reyer, C. P., Schewe, J., Warszawski, L., & Geiger, T. (2017). Assessing the impacts of 1.5 C global warming–simulation protocol of the Inter- Sectoral Impact Model Intercomparison Project (ISIMIP2b). Geoscientific Model Development.
2.1 - Estimated Flood Occurrence (score)	1.41	This risk indicator is based on the recurrence of floods within the 34-year time frame period of 1985 to 2019. The occurrence of floods within a given location was estimated using data from Flood Observatory, University of Colorado. The Flood Observatory use data derived from a wide variety of news, governmental, instrumental, and remote sensing source.	Brakenridge, G. R. (2019). Global active archive of large flood events. Dartmouth Flood Observatory, University of Colorado.
2.1 - Estimated Flood Occurrence (rank)	182	This risk indicator is based on the recurrence of floods within the 34-year time frame period of 1985 to 2019. The occurrence of floods within a given location was estimated using data from Flood Observatory, University of Colorado. The Flood Observatory use data derived from a wide variety of news, governmental, instrumental, and remote sensing source.	Brakenridge, G. R. (2019). Global active archive of large flood events. Dartmouth Flood Observatory, University of Colorado.

Indicator	Value	Description	Source
2.2 - Projected Change in Flood Occurrence (by ~2050) (score)	1.74	This risk indicator is based on multi-model simulation that applies both global climate and drought models from the Inter-Sectoral Impact Model Intercomparison Project (ISIMIP). The magnitude of the flood event was defined based on 100-year return period for pre-industrial conditions. Results are expressed in terms of change (%) in probability between pre- industrial and 2°C scenarios.	Frieler, K., Lange, S., Piontek, F., Reyer, C. P., Schewe, J., Warszawski, L., & Geiger, T. (2017). Assessing the impacts of 1.5 C global warming–simulation protocol of the Inter- Sectoral Impact Model Intercomparison Project (ISIMIP2b). Geoscientific Model Development.
2.2 - Projected Change in Flood Occurrence (by ~2050) (rank)	157	This risk indicator is based on multi-model simulation that applies both global climate and drought models from the Inter-Sectoral Impact Model Intercomparison Project (ISIMIP). The magnitude of the flood event was defined based on 100-year return period for pre-industrial conditions. Results are expressed in terms of change (%) in probability between pre- industrial and 2°C scenarios.	Frieler, K., Lange, S., Piontek, F., Reyer, C. P., Schewe, J., Warszawski, L., & Geiger, T. (2017). Assessing the impacts of 1.5 C global warming-simulation protocol of the Inter- Sectoral Impact Model Intercomparison Project (ISIMIP2b). Geoscientific Model Development.
3.1 - Surface Water Contamination Index (score)	3.91	The underlying data for this risk indicator is based on a broad suite of pollutants with well-documented direct or indirect negative effects on water security for both humans and freshwater biodiversity, compiled by Vörösmarty et al. (2010). The negative effects are specific to individual pollutants, ranging from impacts mediated by eutrophication such as algal blooms and oxygen depletion (e.g., caused by phosphorus and organic loading) to direct toxic effects (e.g., caused by pesticides, mercury). The overall Surface Water Contamination Index is calculated based on a range of key pollutants with different weightings according to the level of their negative effects on water security for both humans and freshwater biodiversity: soil salinization (8%), nitrogen (12%) and phosphorus (P, 13%) loading, mercury deposition (5%), pesticide loading (10%), sediment loading (17%), organic loading (as Biological Oxygen Demand, BOD; 15%), potential acidification (9%) and thermal alteration (11%).	Vörösmarty, C. J., McIntyre, P. B., Gessner, M. O., Dudgeon, D., Prusevich, A., Green, P., & Davies, P. M. (2010). Global threats to human water security and river biodiversity. Nature, 467(7315), 555.

Indicator	Value	Description	Source
3.1 - Surface Water Contamination Index (rank)	30	The underlying data for this risk indicator is based on a broad suite of pollutants with well-documented direct or indirect negative effects on water security for both humans and freshwater biodiversity, compiled by Vörösmarty et al. (2010). The negative effects are specific to individual pollutants, ranging from impacts mediated by eutrophication such as algal blooms and oxygen depletion (e.g., caused by phosphorus and organic loading) to direct toxic effects (e.g., caused by pesticides, mercury). The overall Surface Water Contamination Index is calculated based on a range of key pollutants with different weightings according to the level of their negative effects on water security for both humans and freshwater biodiversity: soil salinization (8%), nitrogen (12%) and phosphorus (P, 13%) loading, mercury deposition (5%), pesticide loading (10%), sediment loading (17%), organic loading (as Biological Oxygen Demand, BOD; 15%),	Vörösmarty, C. J., McIntyre, P. B., Gessner, M. O., Dudgeon, D., Prusevich, A., Green, P., & Davies, P. M. (2010). Global threats to human water security and river biodiversity. Nature, 467(7315), 555.
4.1 - Fragmentation Status of Rivers (score)	2.93	This risk indicator is based on the data set by Grill et al. (2019) mapping the world's free-flowing rivers. Grill et al. (2019) compiled a geometric network of the global river system and associated attributes, such as hydro-geometric properties, as well as pressure indicators to calculate an integrated connectivity status index (CSI). While only rivers with high levels of connectivity in their entire length are classified as free-flowing, rivers of CSI < 95% are considered as fragmented at a certain degree.	Grill, G., Lehner, B., Thieme, M., Geenen, B., Tickner, D., Antonelli, F., & Macedo, H. E. (2019). Mapping the world's free-flowing rivers. Nature, 569(7755), 215.
4.1 - Fragmentation Status of Rivers (rank)	79	This risk indicator is based on the data set by Grill et al. (2019) mapping the world's free-flowing rivers. Grill et al. (2019) compiled a geometric network of the global river system and associated attributes, such as hydro-geometric properties, as well as pressure indicators to calculate an integrated connectivity status index (CSI). While only rivers with high levels of connectivity in their entire length are classified as free-flowing, rivers of CSI < 95% are considered as fragmented at a certain degree.	Grill, G., Lehner, B., Thieme, M., Geenen, B., Tickner, D., Antonelli, F., & Macedo, H. E. (2019). Mapping the world's free-flowing rivers. Nature, 569(7755), 215.
4.2 - Catchment Ecosystem Services Degradation Level (tree cover loss) (score)	1.00	For this risk indicator, tree cover loss was applied as a proxy to represent catchment ecosystem services degradation since forests play an important role in terms of water regulation, supply and pollution control. The forest cover data is based on Hansen et al.'s global Landsat data at a 30-meter spatial resolution to characterize forest cover and change. The authors defined trees as vegetation taller than 5 meters in height, and forest cover loss as a stand-replacement disturbance, or a change from a forest to non-forest state, during the period 2000 – 2018.	Hansen, M. C., Potapov, P. V., Moore, R., Hancher, M., Turubanova, S. A. A., Tyukavina, A., & Kommareddy, A. (2013). High-resolution global maps of 21st-century forest cover change. science, 342(6160), 850-853.

Indicator	Value	Description	Source
4.2 - Catchment Ecosystem Services Degradation Level (tree cover loss) (rank)	162	For this risk indicator, tree cover loss was applied as a proxy to represent catchment ecosystem services degradation since forests play an important role in terms of water regulation, supply and pollution control. The forest cover data is based on Hansen et al.'s global Landsat data at a 30-meter spatial resolution to characterize forest cover and change. The authors defined trees as vegetation taller than 5 meters in height, and forest cover loss as a stand-replacement disturbance, or a change from a forest to non-forest state, during the period 2000 – 2018.	Hansen, M. C., Potapov, P. V., Moore, R., Hancher, M., Turubanova, S. A. A., Tyukavina, A., & Kommareddy, A. (2013). High-resolution global maps of 21st-century forest cover change. science, 342(6160), 850-853.
4.3 - Projected Impacts on Freshwater Biodiversity (score)	4.55	The study by Tedesco et al. (2013) to project changes [% increase or decrease] in extinction rate by ~2090 of freshwater fish due to water availability loss from climate change is used as a proxy to estimate the projected impacts on freshwater biodiversity.	Tedesco, P. A., Oberdorff, T., Cornu, J. F., Beauchard, O., Brosse, S., Dürr, H. H., & Hugueny, B. (2013). A scenario for impacts of water availability loss due to climate change on riverine fish extinction rates. Journal of Applied Ecology, 50(5), 1105-1115.
4.3 - Projected Impacts on Freshwater Biodiversity (rank)	14	The study by Tedesco et al. (2013) to project changes [% increase or decrease] in extinction rate by ~2090 of freshwater fish due to water availability loss from climate change is used as a proxy to estimate the projected impacts on freshwater biodiversity.	Tedesco, P. A., Oberdorff, T., Cornu, J. F., Beauchard, O., Brosse, S., Dürr, H. H., & Hugueny, B. (2013). A scenario for impacts of water availability loss due to climate change on riverine fish extinction rates. Journal of Applied Ecology, 50(5), 1105-1115.
5.1 - Freshwater Policy Status (SDG 6.5.1) (score)	3.00	This risk indicator is based on SDG 6.5.1. Degree of IWRM Implementation "National Water Resources Policy" indicator, which corresponds to one of the three national level indicators under the Enabling Environment category.	UN Environment (2018). Progress on integrated water resources management. Global baseline for SDG 6 Indicator 6.5.1: degree of IWRM implementation.
5.1 - Freshwater Policy Status (SDG 6.5.1) (rank)	50	This risk indicator is based on SDG 6.5.1. Degree of IWRM Implementation "National Water Resources Policy" indicator, which corresponds to one of the three national level indicators under the Enabling Environment category.	UN Environment (2018). Progress on integrated water resources management. Global baseline for SDG 6 Indicator 6.5.1: degree of IWRM implementation.
5.2 - Freshwater Law Status (SDG 6.5.1) (score)	3.00	This risk indicator is based on SDG 6.5.1. Degree of IWRM Implementation "National Water Resources Law(s)" indicator, which corresponds to one of the three national level indicators under the Enabling Environment category. For SDG 6.5.1, enabling environment depicts the conditions that help to support the implementation of IWRM, which includes legal and strategic planning tools for IWRM.	UN Environment (2018). Progress on integrated water resources management. Global baseline for SDG 6 Indicator 6.5.1: degree of IWRM implementation.

Indicator	Value	Description	Source
5.2 - Freshwater Law Status (SDG 6.5.1) (rank)	59	<ul> <li>This risk indicator is based on SDG 6.5.1. Degree of IWRM Implementation "National Water Resources Law(s)" indicator, which corresponds to one of the three national level indicators under the Enabling Environment category.</li> <li>For SDG 6.5.1, enabling environment depicts the conditions that help to support the implementation of IWRM, which includes legal and strategic planning tools for IWRM.</li> </ul>	UN Environment (2018). Progress on integrated water resources management. Global baseline for SDG 6 Indicator 6.5.1: degree of IWRM implementation.
5.3 - Implementation Status of Water Management Plans (SDG 6.5.1) (score)	3.00	This risk indicator is based on SDG 6.5.1. Degree of IWRM Implementation "National IWRM plans" indicator, which corresponds to one of the three national level indicators under the Enabling Environment category. For SDG 6.5.1, enabling environment depicts the conditions that help to support the implementation of IWRM, which includes legal and strategic planning tools for IWRM.	UN Environment (2018). Progress on integrated water resources management. Global baseline for SDG 6 Indicator 6.5.1: degree of IWRM implementation.
5.3 - Implementation Status of Water Management Plans (SDG 6.5.1) (rank)	61	This risk indicator is based on SDG 6.5.1. Degree of IWRM Implementation "National IWRM plans" indicator, which corresponds to one of the three national level indicators under the Enabling Environment category. For SDG 6.5.1, enabling environment depicts the conditions that help to support the implementation of IWRM, which includes legal and strategic planning tools for IWRM.	UN Environment (2018). Progress on integrated water resources management. Global baseline for SDG 6 Indicator 6.5.1: degree of IWRM implementation.
6.1 - Corruption Perceptions Index (score)	4.00	This risk Indicator is based on the latest Transparency International's data: the Corruption Perceptions Index 2018. This index aggregates data from a number of different sources that provide perceptions of business people and country experts on the level of corruption in the public sector.	Transparency International (2019). Corruption Perceptions Index 2018. Berlin: Transparency International.
6.1 - Corruption Perceptions Index (rank)	39	This risk Indicator is based on the latest Transparency International's data: the Corruption Perceptions Index 2018. This index aggregates data from a number of different sources that provide perceptions of business people and country experts on the level of corruption in the public sector.	Transparency International (2019). Corruption Perceptions Index 2018. Berlin: Transparency International.
6.2 - Freedom in the World Index (score)	5.00	This risk indicator is based on Freedom House (2019), an annual global report on political rights and civil liberties, composed of numerical ratings and descriptive texts for each country and a select group of territories. The 2019 edition involved more than 100 analysts and more than 30 advisers with global, regional, and issue-based expertise to covers developments in 195 countries and 14 territories from January 1, 2018, through December 31, 2018.	Freedom House (2019). Freedom in the world 2019. Washington, DC: Freedom House.

Indicator	Value	Description	Source
6.2 - Freedom in the World Index (rank)	16	This risk indicator is based on Freedom House (2019), an annual global report on political rights and civil liberties, composed of numerical ratings and descriptive texts for each country and a select group of territories. The 2019 edition involved more than 100 analysts and more than 30 advisers with global, regional, and issue-based expertise to covers developments in 195 countries and 14 territories from January 1, 2018, through December 31, 2018.	Freedom House (2019). Freedom in the world 2019. Washington, DC: Freedom House.
6.3 - Business Participation in Water Management (SDG 6.5.1) (score)	3.00	This risk indicator is based on SDG 6.5.1. Degree of IWRM Implementation "Business Participation in Water Resources Development, Management and Use" indicator, which corresponds to one of the six national level indicators under the Institutions and Participation category.	UN Environment (2018). Progress on integrated water resources management. Global baseline for SDG 6 Indicator 6.5.1: degree of IWRM implementation.
6.3 - Business Participation in Water Management (SDG 6.5.1) (rank)	60	This risk indicator is based on SDG 6.5.1. Degree of IWRM Implementation "Business Participation in Water Resources Development, Management and Use" indicator, which corresponds to one of the six national level indicators under the Institutions and Participation category.	UN Environment (2018). Progress on integrated water resources management. Global baseline for SDG 6 Indicator 6.5.1: degree of IWRM implementation.
7.1 - Management Instruments for Water Management (SDG 6.5.1) (score)	3.00	<ul> <li>This risk indicator is based on SDG 6.5.1. Degree of IWRM Implementation "Sustainable and efficient water use management" indicator, which corresponds to one of the five national level indicators under the Management Instruments category.</li> <li>For SDG 6.5.1, management instruments refer to the tools and activities that enable decision-makers and users to make rational and informed choices between alternative actions.</li> </ul>	UN Environment (2018). Progress on integrated water resources management. Global baseline for SDG 6 Indicator 6.5.1: degree of IWRM implementation.
7.1 - Management Instruments for Water Management (SDG 6.5.1) (rank)	43	<ul> <li>This risk indicator is based on SDG 6.5.1. Degree of IWRM Implementation "Sustainable and efficient water use management" indicator, which corresponds to one of the five national level indicators under the Management Instruments category.</li> <li>For SDG 6.5.1, management instruments refer to the tools and activities that enable decision-makers and users to make rational and informed choices between alternative actions.</li> </ul>	UN Environment (2018). Progress on integrated water resources management. Global baseline for SDG 6 Indicator 6.5.1: degree of IWRM implementation.

Indicator	Value	Description	Source
7.2 - Groundwater Monitoring Data Availability and Management (score)	3.00	This risk indicator is based on the data set by UN IGRAC (2019) to determine the level of availability of groundwater monitoring data at country level as groundwater management decisions rely strongly on data availability. The level of groundwater monitoring data availability for groundwater management is determined according to a combination of three criteria developed by WWF and IGRAC: 1) Status of country groundwater monitoring programme, 2) groundwater data availability for NGOs and 3) Public access to processed groundwater monitoring data.	UN IGRAC (2019). Global Groundwater Monitoring Network GGMN Portal. UN International Groundwater Resources Assessment Centre (IGRAC).
7.2 - Groundwater Monitoring Data Availability and Management (rank)	50	This risk indicator is based on the data set by UN IGRAC (2019) to determine the level of availability of groundwater monitoring data at country level as groundwater management decisions rely strongly on data availability. The level of groundwater monitoring data availability for groundwater management is determined according to a combination of three criteria developed by WWF and IGRAC: 1) Status of country groundwater monitoring programme, 2) groundwater data availability for NGOs and 3) Public access to processed groundwater monitoring data.	UN IGRAC (2019). Global Groundwater Monitoring Network GGMN Portal. UN International Groundwater Resources Assessment Centre (IGRAC).
7.3 - Density of Runoff Monitoring Stations (score)	3.51	The density of monitoring stations for water quantity was applied as proxy to develop this risk indicator. The Global Runoff Data Base was used to estimate the number of monitoring stations per 1000km2 of the main river system (data base access date: May 2018).	BfG (2019). Global Runoff Data Base. German Federal Institute of Hydrology (BfG).
7.3 - Density of Runoff Monitoring Stations (rank)	86	The density of monitoring stations for water quantity was applied as proxy to develop this risk indicator. The Global Runoff Data Base was used to estimate the number of monitoring stations per 1000km2 of the main river system (data base access date: May 2018).	BfG (2019). Global Runoff Data Base. German Federal Institute of Hydrology (BfG).
8.1 - Access to Safe Drinking Water (score)	1.00	This risk indicator is based on the Joint Monitoring Programme for Water Supply, Sanitation and Hygiene (UNICEF/WHO) 2019 data. It provides estimates on the use of water, sanitation and hygiene by country for the period 2000-2017.	WHO & UNICEF (2019). Estimates on the use of water, sanitation and hygiene by country (2000- 2017). Joint Monitoring Programme for Water Supply, Sanitation and Hygiene.
8.1 - Access to Safe Drinking Water (rank)	108	This risk indicator is based on the Joint Monitoring Programme for Water Supply, Sanitation and Hygiene (UNICEF/WHO) 2019 data. It provides estimates on the use of water, sanitation and hygiene by country for the period 2000-2017.	WHO & UNICEF (2019). Estimates on the use of water, sanitation and hygiene by country (2000- 2017). Joint Monitoring Programme for Water Supply, Sanitation and Hygiene.
8.2 - Access to Sanitation (score)	1.00	This risk indicator is based on the Joint Monitoring Programme for Water Supply, Sanitation and Hygiene (UNICEF/WHO) 2019 data. It provides estimates on the use of water, sanitation and hygiene by country for the period 2000-2017.	WHO & UNICEF (2019). Estimates on the use of water, sanitation and hygiene by country (2000- 2017). Joint Monitoring Programme for Water Supply, Sanitation and Hygiene.

# **Country Aspects**

#### **1. PHYSICAL ASPECTS**

#### **1.1.WATER RESOURCES**

#### **1.1.1.WATER RESOURCES**

The river runoff originating in the country is estimated at 1.0km<sup>3</sup>/year. Several rivers are found in Turkmenistan, most of them flowing into the country from its neighbours.

The largest and most important waterway in Turkmenistan is the Kara Kum canal. This canal was constructed in the 1950s and is, at 1300km, the longest canal in the world. The canal capacity is estimated at 630m<sup>3</sup>/s. Its inlet at the Amu Darya River is located just after the river enters Turkmenistan from Uzbekistan. It brings water to Ashkhabad and to the oases in the south.

There are five major sources of water resources in Turkmenistan:

•the main trans-boundary rivers (the Amu Darya, Atrek, Murgab, and Tedjen);

•the small rivers of the north-western slope of the Kopetdag mountain range;

freshwater aquifers;

•return and drainage waters from irrigation;

•some small natural lakes.

Water management infrastructure includes the Kara Kum canal, artificial reservoirs and lakes, irrigation mains/canals, collector-drainage network, artificial drainage lakes and the Altyn Asyr artificial lake.

The renewable groundwater resources are estimated at 3.36km<sup>3</sup>/year, of which about 3km<sup>3</sup>/year is estimated to be infiltration from rivers, including surface water resources generated in upstream countries. In 1994, the existing equipment enabled a groundwater abstraction of 1.22km<sup>3</sup>/year.

The total internal renewable water resources are thus estimated at 1.36km<sup>3</sup>/year, and the total actual renewable water resources at 24.72km<sup>3</sup>/year.

The volume of treated industrial and domestic wastewater is estimated at 0.025km<sup>3</sup>/year. For the period 1990-94, agricultural drainage water was estimated at about 5.4km<sup>3</sup>/year on average. Water from both sources is mixed in the collector-drainage canals. About 2.35km<sup>3</sup>/year, or 44 per cent of the total, returns to rivers, mainly the Amu Darya River. About 2.97km<sup>3</sup>/year, or 55 per cent, goes to natural depressions, mainly Lake Sarakamysh in the north of the country on the border with Uzbekistan. The remainder, about 0.08km<sup>3</sup>/year (1 per cent), is directly re-used for irrigation.

#### 1.1.2.WATER USE

In 1994, the total annual water withdrawal was estimated at 23.8km<sup>3</sup>, of which 97 per cent was used for agricultural purposes. Recently, there has been a slight fall in the total water withdrawal, mainly because of the adoption of water-saving methods in agriculture. The main source of water

is surface water. Drainage water from irrigated land is also re-used and constitutes another source of water for irrigation. In 1994, 214 million m<sup>3</sup> of groundwater was used for domestic purposes, 151 million m<sup>3</sup> for agriculture and 36 million m<sup>3</sup> for industry.

Turkmenistan's water sector supports not only the irrigation needs of agriculture but also the requirements of other sectors of the economy. Irrigation canals and reservoirs are the sources of water for municipal, domestic and drinking water supply in rural areas; they also secure watering levels for pastures. Other water uses are also supported, including commercial fisheries, energy generation, transport, recreation and sport fishing, navigation and landscaping within residential areas.

#### 1.2. WATER QUALITY, ECOSYSTEMS AND HUMAN HEALTH

Major environmental problems are contamination of soil and groundwater with agricultural chemicals and pesticides; salination; water logging of soil due to poor irrigation methods; Caspian Sea pollution; desertification. Diversion of a large share of the flow of the Amu Darya into irrigation contributes to that river's inability to replenish the Aral Sea.

#### **2. GOVERNANCE ASPECTS**

#### **2.1.WATER INSTITUTIONS**

There are a number of institutional structures set up in Central Asia to manage the region's scarce water resources. These include international bodies such as the Interstate Coordination Water Commission (ICWC), the Interstate Fund for the Aral Sea (IFAS), the Interstate Commission on Sustainable Development (ICSD) and the Centre of Preventive Diplomacy, as well as a number of government agencies in Turkmenistan.

IFAS is a high-level body which carries out activities based on decisions of the leaders of the participating countries, its Secretariat and subsidiary organizations. The key functions of IFAS include:

•funding and crediting of joint interstate environmental and scientific programmes;

•funding of joint fundamental and applied research;

•setting up and operating interstate environmental monitoring networks and corresponding data/information storage systems;

mobilizing resources for joint actions;

•participating in international activities to improve the environmental status of the Aral Sea basin. The main aim of establishing the ICWC was to strengthen the principle of collective leadership in decision-making processes on general issues of regional interstate water management, use and protection, and in implementing joint programmes related to Central Asia's water resources. ICSD coordinates and supervises cooperation in the field of environmental protection and

sustainable development programmes in Central Asia.

The water sector in Turkmenistan is represented by a complex governance system comprising a number of ministries and institutions; very often these authorities share joint responsibilities and functions. In addition to the complicated management structure, national capacity remains a major concern at all levels. Furthermore, there is a lack of interaction and coordination among the ministries and institutions of the water sector. The key specialized governmental ministries responsible for water resource management and protection are the Ministry of Water Resources (MWR) and the Ministry of Nature Protection (MNP), as well as their subordinate offices in the regions.

#### 2.2.WATER MANAGEMENT

In order to implement integrated water resources management (IWRM) nationally a number of core interventions are to be made.

1.Policy, legal and regulatory framework:

a.Defining water and land rights;

b.Modifying agricultural, electricity/power and water-specific strategies and policies;

c.Optimizing subsidies and other supports that distort input use and cropping patterns.

2.Improved management/governance and institutional strengthening:

a.Strengthening of water resource management, development of sound mechanism to avoid duplication of functions of the main governmental authorities, introduction of adaptive management principles;

b.Providing incentives and support for the use of water-saving technologies and other appropriate technology, water harvesting and the uptake of modern water and soil conservation practices;

c.Promoting cooperative management of joint supplies (e.g. groundwater and larger water harvesting structures) to all water users;

d.Developing mechanisms for wider involvement of public and other stakeholders.

3.Infrastructure development:

a.Preparing integrated investment programmes;

b.Investing in support services, including transportation and marketing;

c.Introducing and developing Public-Private Partnerships in water sector.

Turkmenistan supports the principle of IWRM at the highest political level. Considerable efforts and resources are currently put into the development of water management structures and modern practices; however, there has been no regular reporting on the progress available internationally.

Increasing food production is one of the major goals of the national agricultural policy. Irrigation development and agricultural intensification have to be achieved in a general context of limited water resources. Increased re-use of wastewater and of agricultural drainage water is seen as one of the solutions for increasing the water availability needed to enable further irrigation expansion. At the same time, research is being carried out on water-saving techniques, and new measures are expected to be adopted on a large scale to increase irrigation efficiency. Rehabilitation of drainage

and irrigation networks is also envisaged to reduce water losses and to limit the expansion of salinization.

All these measures have been proposed in the national water strategy, part of the regional water strategy. These aimed to contain the irrigation water withdrawal at around 25km<sup>3</sup>/year between 2000 and 2010, compared with 23.2km<sup>3</sup>/year in 1994; the irrigated area was expected to increase from 17,441km2 in 1994 to 23,530km2 in 2010.

Environmental issues are particularly acute in Turkmenistan. Water in the rivers and in the drainage networks is of very poor quality, containing high concentrations of salts and pesticides coming from upstream countries. This also affects the Aral Sea area where some of the main collector-drainage canals discharge. A trans-desert collector running for a total length of about 800km from the northeast to the Caspian Sea in the far west is under construction. It is intended to collect the agricultural drainage waters from the Murghab, the Tedzhen oases, and from the other irrigated areas located along the Kara Kum canal.

#### 2.3. WATER POLICY AND LEGAL FRAMEWORK

The Water Code of Turkmenistan was issued on 27 December 1972. This code is currently under review, and new water legislation is planned for the near future.

The legal framework of water resource management includes:

international agreements/declarations on both environmental issues and transboundary rivers;
the national legal framework, which is formed by the constitution; laws and decrees of Halk Maslakhaty (People's Council) and its chairman; decrees and resolutions of the president; resolutions and decisions of Mejlis (Assembly) and Cabinet of Ministers; decisions and acts of ministries and other national level authorities of state executive power; resolutions of local administrations; other legislation and regulations.

One of the key pieces of legislation is the New Water Code of Turkmenistan, in force since 1 November 2004. The code legally confirmed the current set-up of government power and redistribution of functions and responsibilities in the field of management and conservation of water resources.

#### **3. GEOPOLITICAL ASPECTS**

#### **3.1.ARAL SEA BASIN**

After collapse of the Soviet Union, ministers of five Central Asian independent states agreed a joint statement to prevent conflicts and serious complications in water resources management and to set water allocations, at a conference in Tashkent in 1991. Based on the historical connections of the Central Asian peoples, their equal rights and responsibility for ensuring rational water resources use in the region, and taking natural and economic conditions into account, they recognized that only joint actions can effectively solve the region's water problems in a context of increasing ecological and social tension.

In Almaty in 1992, ministers signed an "Agreement on cooperation in joint management, use and

protection of interstate sources of water resources" and founded the ICWC. This agreement was confirmed by the Decision of the Presidents, Kzyl-Orda, 26 March 1993, and their "Agreement on joint actions on resolving the problems related to the Aral Sea and its coastal zone on environmental sanitation and social-economic development in the Aral Sea region", and later by agreement of the region's five countries of 9 April 1999 "On status of IFAS and its organizations".

The Ashgabat Declaration (1999) focused on the consequences of the Aral Sea crisis, which had negatively affected people's standard of living in Central Asia. The five presidents of the Central Asian countries declared to:

-admit the importance of a comprehensive solution to the social and ecological problems in the Aral Sea basin;

-strengthen, both in the Central Asian states and abroad, activity to attract the attention of the international community and attract funding for projects related to the Aral Sea basin problems;

-provide every kind of assistance and support for implementing a "Control on Water Resources and Environment in Aral Sea basin" project, under the aegis of the World Bank and the Global Economic Forum;

-give more consideration to the problems of mountain territories where the rivers within the Aral Sea basin originate;

-realize a number of all-round measures and priority projects on social protection of people living in the Aral Sea basin;

-accelerate efforts against desertification and pollution;

-assist international organizations and institutions working on programmes and projects related to the Aral Sea basin problems;

-raise public awareness (through educational and other programmes) of the urgent problems of nature protection, rational use of natural resources, and improving the environment for present and future generations.

#### **3.2.OTHER TRANSBOUNDARY WATERS**

During soviet times water resource management issues were dealt with by the Ministry of Land Reclamation and Water Resources of the USSR (MLRWR USSR). Management procedures and practices were prescribed in "Integrated Schemes of Water Use in the Aral Sea Basin" and other similar regulatory documents/plans. These documents took account of the actual hydrological situation in a particular region and/or river stretch (floods, low water periods, droughts, etc.).

After the break-up of the USSR, Turkmenistan, as a legal successor of the USSR on its territory, confirmed the obligations between Iran and USSR on the transboundary rivers and waters. These obligations are included in:

-The Agreement between the USSR and Persia on the joint use of transboundary rivers and water along the border between the two countries from the Geri-Rud River (current name – the Tedjen River) to the Caspian Sea, dated 20 February 1926;

-The Protocol to the Agreement above on settling disputes on transboundary and financial issues, dated 02 December 1954;

-The Agreement between the government of the USSR and the Shahanshah government of Iran on the regime of the Soviet-Iranian border and procedure to resolve border conflicts and incidents, dated 14 May 1957, signed in Moscow;

-The Soviet-Iranian Agreements on the transboundary rivers of Araks and Atrek, dated 11 August 1957, signed in Tehran;

-The Agreement between the USSR government and the Shahanshah government of Iran on the development of temporary procedures on the equal water distribution and use of border stretches of the Araks and Atrek rivers for the purposes of irrigation and power generation, dated 05 March 1958, signed in Tehran.

A number critical management issues were addressed in these agreements, such as sustainability of riverbeds, particularly in areas where the state border was defined along the rivers. In addition, corresponding officials were defined to deal with international disputes, if such disputes were to arise. Nearly all rivers of the Kopetdag Mountains are covered by these agreements.
